

What are the common factors that make an NBA rebuild unsuccessful?

April 25, 2023

Word Count: 5497

Abstract

Rebuilding in the NBA has become a commonplace principle adopted by a variety of franchises over the last thirty years. Teams have employed a plethora of strategies in order to attempt to revamp their roster for success, including trading away key players, tanking for high draft picks, and signing impactful free agents. This study examines the common factors found in unsuccessful rebuilds by using a collective case study analysis to compare player and front office variables associated with four unsuccessful and four successful rebuilds within the last fifteen years. Rebuilds were labeled unsuccessful or successful based on the consistency of their post-rebuild success. After two rounds of data collection and analysis, five possible factors were determined to be affecting both groups of rebuilds differently. This study concluded that four out of the five initial factors (free agent signings and extensions, payroll distribution, draft picks, and team culture) were common factors negatively impacting the rebuilds of each unsuccessful team.

Introduction

In the NBA (National Basketball Association) a new strategy for roster development, known as rebuilding, has become an increasingly enticing option for front offices to resort to. Over the last 10 years, the concept has gained popularity with at least seven teams going through the rebuilding process in some shape or fashion (Buckley). A rebuild is defined as the point in time when a team gathers a large sum of young players, upcoming draft picks, and expiring contracts in exchange for their aging or current star players (Bleacher Report). Owners and general managers implement this approach with the hopes of giving their franchise the best chance at winning a championship. I, myself, have always had a fascination with the rebuilding process, attempting to recreate hundreds of various scenarios with my favorite teams in the video game, NBA 2K. Time and time again, I have found myself wondering why certain teams made rebuilding look easy, while others struggled to get themselves out of the mess they created. Luckily, a range of experts have expressed their passionate views and findings, which have led to interesting discussions regarding the topic of my research question: rebuilding in the NBA. However, this information has failed to provide the answer needed to cure my curiosity.

Gap in the Research

The gap proposed and addressed by my research question is the observation and analysis of multiple, possible factors that lead to an NBA rebuild being successful or unsuccessful. Many writers and researchers simply list rebuilds that are taking place or have taken place in the past, or discuss one or two specific factors that may have contributed to those rebuilds. Others will touch on and briefly evaluate whether a certain rebuild worked or not. Through my study, I desire to compare what the unsuccessful teams did in their rebuilds to what the successful teams did. That requires looking at factors possibly contributing to failed rebuilds to see if they are

truly having a negative impact on those franchises. Whatever may be affecting the trajectory of these rebuilds is crucial information needed for me to try bridge the apparent gap and answer my research question: What are the common factors that make an NBA rebuild unsuccessful? By diving deeper and examining key rebuilds that have occurred over the last 10-15 years, I may be able to address the research gap proposed by my question.

Literature Review

First, it is worth mentioning the discussion of a past rebuilding attempt carried out by the Philadelphia 76ers, as an example of how experts differ in their expectations of a rebuild. In a CBS article written in 2015, Matt Moore examined three separate teams, the 76ers being one of them, and described how the 2016 season was a crucial point in determining the validity of their rebuilds. When Moore brought up the 76ers, he touches on how they took the long route to rebuilding by trading away prime players in 2012 and continuing to tank each of the following three years (Moore). “Tanking” is a strategy encouraged by some front offices in order to expedite the rebuilding process. It involves purposely constructing a roster packed with young talent, but setting no expectations for success and instead focusing on losing as many games in a given season in order to try and obtain the highest pick in the NBA Draft (Spencer). Moore emphasizes that because the 76ers committed to this approach (dubbed “The Process”), it would end up hurting the team culture for years to come by making players and coaches comfortable with the idea of losing as a means to stockpile young stars for the future (Moore). Contrastingly, Ben Golliver, a writer for Sports Illustrated, was particularly optimistic about the fact that the 76ers found their star of the future by drafting Joel Embiid in 2014 and then proceeding to build around him by drafting Ben Simmons with the #1 pick in 2017. Golliver still held the belief that the 76ers were not out of the woods yet and that 2017 would be an even bigger indicator as to the

success of “The Process” (Golliver). These experts provide quality opinions on the rebuilding process of teams like the 76ers, but only focus on the effects of factors such as draft strategy and front office personnel. My study aims to review and address a more expansive list of factors, as opposed to just two or three.

Other sources, like certain scholarly studies zero in on using data to evaluate different factors correlated with NBA rebuilds. The first factor highlighted is the NBA draft decision-making process and how front offices can utilize predictive models to draft players fit for their system. In 2019, Alex Beene created a simple model that breaks NCAA players down into three positions (Ball-handlers, Wings, and Bigs) instead of the traditional five spots (Point Guard, Shooting Guard, Small Forward, Power Forward, and Center) using Play-By-Play NCAA metrics provided by an outside source. Essentially, the model quantified hundreds of NCAA players’ skill sets and turned them into easy-to-understand percentages for front offices to use as part of their consideration for drafting future players. Beene feels this model is significant because it opens the door and inspires others to condense scouting results by turning them into simple data points that can help to measure a player’s projected impact (Beene 1-12). A similar study was conducted in 2018 by Daniel Sailofsky, in which he used detailed statistics to examine factors that may help to predict the future draft positions of NCAA players from the years 2006-2013. He uses his data analysis, in part, to argue that NBA executives should avoid going with their gut when it comes to drafting players, and instead focus on taking a deeper dive at what the stats say about those players (Sailofsky 2-3, 95-98). These two studies do a good job of providing a way to evaluate the effectiveness of potential draft prospects through data, but do not account for a team’s draft pick history and how that factors into the success of the rebuilding process.

A second factor impacting a team's ability to successfully rebuild is payroll distribution. One of the key sources in my research is a 2017 study conducted by Will T. Patterson, in which he examines the payroll distributions of four NBA teams that were successful in their front office approach. A common thread found amongst these teams is that they all, at some point in their tenure of success, utilized a tiered distribution approach to player salaries. A tiered distribution approach is when the five starters on a team get paid roughly the same amount of money and the bench players also get paid roughly the same amount across the board. The starters are paid about twice as much as the bench players. This approach is significant for financially-limited teams looking to rebuild their roster without having to spend significant amounts of money on superstar players who might get injured or end up leaving a few years after signing. These teams can better attempt successful rebuilds by focusing on selecting quality players in the draft and signing them to relatively cheap contracts. They can then go out and sign mid-level players to compliment those draft picks without having to break the bank. Patterson elaborates on the effect of equitable payroll distributions, but analyzes some teams that were not in the rebuilding process, like the Dallas Mavericks. All teams used in my study will be evaluated based on the factors influencing them during their rebuilding process, as using this timeline will be a crucial part of answering my research question.

Finally, two other sources discuss a third factor involved in the NBA rebuilding process, trading players. A study published in the International Journal of Computer Science in Sport, provides a way to measure the strength of chemistry between players, aka the synergy, in order to simulate "mutually beneficial" trades between teams. The researchers used an SPM (Skills Plus Minus) system to measure the individual skills and impact of players across the league. Their findings were significant as they shed light on the importance for front offices to make trades

that form synergistic lineups. As stated in the study, “1-2 points per game can translate into 3-6 wins per season (for a team that would otherwise score and allow 100 points per game). Thus a team that consistently fields a highly positively synergistic lineup will win up to six games more than if it consistently fields a highly negatively synergistic lineup” (Maymin et. al 12, 16-17). Similarly, Mark Cuban, owner of the Dallas Mavericks, expressed his thoughts on the consequences of trading for the wrong players, “When the Mavs have brought in players that didn’t fit or buy into our culture it created on the court and off the court problems” (Cuban). This statement agrees with the study as it highlights what can happen if risky trades and free agent signings lead to negatively synergetic lineups. Teams must consider the players they choose to bring on board during the rebuilding process if they want to establish and maintain a winning culture.

Many sources have generally listed rebuilds as being successes or failures (Bailey; Buckley; Golliver) or have simply brought up one factor that may be impacting the rebuilding process throughout the NBA (Patterson; Maymin et. al; Beene). I plan to identify and analyze several underlying, or maybe obvious factors that are common throughout unsuccessful rebuilds, as well analyze how those same factors are impacting successful rebuilds. My analysis will include potential factors such as a team’s free agent signings, draft pick history, trade history, payroll distribution, and culture. Ideally, I will have identified possible common factors that have caused detrimental team rebuilds, providing a framework for what teams ought not to do. Through findings of this study, I hope to provide an outline that allows NBA teams to optimize and improve the effectiveness of their rebuilding process.

Methods

In order to sufficiently determine which factors were truly impacting the unsuccessful rebuilds, I conducted a collective case study analysis for the two groups, unsuccessful and successful, of NBA rebuilds examined. The analysis was done on the four teams with unsuccessful rebuilds (Brooklyn Nets, Detroit Pistons, Sacramento Kings, and Orlando Magic) over a time span of thirteen years from 2009-2022, and the four teams with successful rebuilds (Boston Celtics, Philadelphia 76ers, Golden State Warriors, and Phoenix Suns) over a time span of ten years from 2010-2020. Each team was chosen based on the fact that they had undergone a major roster construction at some point in the last fifteen years (Moore; Bailey). Choosing these eight rebuilds to draw data from over the specified time span gave me an adequate sample size covering the majority of notable rebuilds in recent years.

Table 1.1: Timeline and Type of Rebuild for Each Team

Team	Length	Type
Phoenix Suns	2013-2020 (7 years)	Successful
Boston Celtics	2013-2018 (5 years)	Successful
Philadelphia 76ers	2013-2019 (6 years)	Successful
Golden State Warriors	2010-2014 (4 years)	Successful
Brooklyn Nets	2015-2020 (5 years)	Unsuccessful
Detroit Pistons	2009-2015 (6 years)	Unsuccessful
Sacramento Kings	2016-2022 (6 years)	Unsuccessful
Orlando Magic	2012-2018 (6 years)	Unsuccessful

Determining the Proper Timelines

Time frames varied for each rebuild, but for the most part the analysis for each team was focused on a period of 4-7 years. This accounted for the start of the rebuild all the way towards the tail end of the rebuild. I defined the start of the rebuild as the period when teams began to part ways with their star players, as evidenced by the Boston Celtics. In 2013, the Celtics kickstarted their rebuild by trading two superstar players, Kevin Garnett and Paul Pierce, to the Brooklyn Nets in exchange for a multitude of draft picks (Forsberg and Knox). The end of the rebuilding process was virtually the same for both groups. For the unsuccessful batch, I defined the end as the final year before each team made the playoffs with a developed roster. For example, I determined that the final year of the rebuilding process for the Detroit Pistons was the 2014-15 season as they proceeded to make the playoffs the following year with a solid nucleus of young players. Similarly, the ending point for the successful batch was determined to be the time at which the team was starting to consistently make the playoffs with their core of developed talent, hence covering the statistics associated with the first couple years of their success. Using the 76ers as an example, I chose their ending point to be the 2018-19 season because this was the second year in a row making the playoffs while still acquiring complementary players to surround their stars.

Determining the Type of Rebuild

For the purpose of determining which teams had rebuilds considered to be “successful” or considered to be “unsuccessful” I looked at the years following the end of their established rebuilding timelines. A team’s rebuild was determined to be successful if the team achieved sustained success and built upon it after the ending of its rebuilding process. Following the end of their respective rebuilds, the 76ers, Warriors, Suns, and Celtics have all made it to the playoffs

each year since. Building upon that success, the Warriors went on to win three NBA championships within the next 5 years, the Suns made it to the 2021 NBA Finals, and the Celtics made it to the 2022 NBA Finals (Basketball-Reference). On the other hand, a team's rebuild was determined to be unsuccessful if they failed to sustain success following the end of their rebuilding process. Between the Magic, Pistons, and Kings, they have only made the playoffs a combined six times since, with the Nets being the lone outlier. The Nets, although they made the playoffs two straight years following their rebuild, failed to make it past the second round and have been unable to build upon that initial success.

Data Analysis

To start off my collective case study analysis, I conducted a preliminary round of research where I collected data on a large range of variables measuring overall team success and performance. These included staff turnover, general team statistics (record, Win%, PPG, OPPG, etc.), finances, and draft/transaction history. Data was sorted into tables using Google Sheets, see Appendix B. Examining these general statistics allowed me to narrow the set of variables down to those showing a clear difference in value between the two types of rebuilds. The tables below display the variables measured and the differences in average values per season. For example, recognizing that the unsuccessful rebuilds averaged fewer points per game (PPG) and had a worse defensive rating (DRtg) led me to further examine the players those teams brought in and their impact. Finding these differences helped me to realize which variables represented possible factors across unsuccessful teams.

Table 1.2: Comparison of General Variables Associated With the Two Types of Rebuilds

Variables	Unsuccessful (5.8 yrs*)	Successful (5.5 yrs*)
Wins	29	35 (+6)
Losses	51	46 (-5)
Win %	0.36	0.423 (+6.3%)
PPG	102.3 (20th)	103.5 (15th)
OPPG	106.5 (21st)	106 (21st)
ORtg	105.4 (22nd)	104.8 (19th)
DRtg	109.6 (22nd)	107.1 (17th)
Payroll**	\$86.5 million (21st)	\$78.8 million (22nd)
NBA Salary Cap	\$82.5 million	\$77.3 million
Cap Space**	-\$4 million	-\$1.5 million
Average Player Age (APA)***	25.7 (19th)	23.9 (23rd)
NBA APA	26.7	26.8

Note. Each data value is the average per season for that group of rebuilds over the specified time span. For example, the four unsuccessful rebuilds had an average ranking of 15th with an average of 103.5 PPG per season over their 5.8 year average rebuilding time span. Data in this table is derived from Basketball-Reference.com, HoopsHype.com, TheHoopsGeek.com, NBA.com, and TeamRankings.com.

*Average length of each type of rebuild

**Fluctuate in value and vary more than other variables

***Lower rank, or lower number, (23.9 - 23rd) representing lower player age is considered better for rebuilding than a higher rank, or a higher number (25.7 - 19th)

Table 1.3: Comparison of General Draft and Transaction Variables Associated With the Two Types of Rebuilds

Variables	Unsuccessful (5.8 yrs)	Successful (5.5 yrs)
Total Picks	1.7	2.5
Lottery Picks	0.7	0.7
Draft Score*	-0.11 (14th)	0.11 (12th)
Transactions**	28.6	34.1

Trades	3.4	5.2
Waived/Released Players	7	9.2
Signings****	9.3	9.9
Retained Players	7.6 (44.1%)	7.2 (37.3%)
Retained Draft Picks***	3.4 (45.6%)	3.4 (45.7%)

Note. Each data value is the average per season for that group of rebuilds over the specified time span. For example, the four unsuccessful rebuilds had an average of 28.6 transactions per season over their 5.8 year average rebuilding time span. Data in this table is derived from Basketball-Reference.com, and TeamRankings.com.

*DEEP NBA Draft.com

**Transaction count does not include players moving up and down from the G-League (the NBA development league)

***This stat represents the number of players drafted by the team that are retained from year-to-year

****The amount of player signings includes extensions

For my second round of data analysis, I took a more in depth look at specific factors to see their effects on the unsuccessful rebuilds compared to the successful rebuilds. Based on certain glaring differences in averages within the first round of variables, there were five possible factors, similar to the ones discussed in the literature review, that showed promise: player signings/extensions, payroll distributions, draft picks, trades, and team culture. Data collection for these factors can be found in Appendices C-G. In order to evaluate whether these factors actually impacted the unsuccessful rebuilds, I took the averages of each related variable for each team and compared them to the numbers for the successful rebuilds, similar to what was done in Tables 1.2 and 1.3. Using collective case study analysis helped me to decipher the relevant and common factors contributing to unsuccessful rebuilds from the irrelevant and inconsistent ones.

Results

Signings and Extensions

First, free agent signings and player extensions were determined to be a possible factor influencing the unsuccessful rebuilds. I compared the averages of each team's five biggest free agent signings or player extensions over their timelines (see Appendix C for each team's signing breakdown) and sorted them into the two types of rebuilds. Table 2.1 displays general contract information regarding both types of rebuilds. On average, the successful teams signed shorter contracts with a slightly less annual value per contract. The big difference is that the unsuccessful group signed and extended their players to total contract amounts that were about \$20 million more, on average, than the successful groups' total contract amounts.

Table 2.1: Comparison of Key Free Agent Signing and Player Extension Contract Terms

	Unsuccessful (5.8 yrs)	Successful (5.5 yrs)
Tenure*	2.4	2.4
Contract Length*	3.7	3
Contract Amount	\$58.5 million	\$37.9 million
Annual Value	\$15.6 million	\$12.1 million

Note. Data in this table is derived from Basketball-Reference.com, HoopsHype.com, and HoopsRumors.com. Tenure is the amount of time a player spent with the team after signing a contract.

*in years

Table 2.2 shows a clear difference between player performance before and after signing a deal with unsuccessful teams compared to successful teams. Players started and played fewer games after signing a deal with an unsuccessful team, while experiencing the opposite effect with successful teams. Overall, players stats decreased in each category displayed under the unsuccessful rebuilds, but increased in each category displayed under the successful rebuilds.

However, it is also worth noting that the unsuccessful teams signed higher profile players than the successful teams, as their statistics after signing were very similar to the unsuccessful groups' statistics after signing. Nonetheless, it's clear that player performance was negatively affected by signing contracts with unsuccessful teams, while being positively affected by signing contracts with successful teams, player age being a non-factor.

Table 2.2: Comparison of Player Statistics Before and After Signing An Extension or Free Agent Deal

Variables	Unsuccessful		Successful	
	Before	After	Before	After
Avg GS	46	39	29	36
Avg GP	64	53	58.5	59
Start %	74.1	72.5	50.5	58.4
MP	29.2	27.7	25.3	25.4
FG%	0.472	0.46	0.473	0.479
PPG	14	13.6	10.7	11.1
RPG	4.6	4.6	4.3	4.4
APG	2.5	2.9	2.2	2.5
Age	27.4	29.8	27.9	30.3

Note. Each data value is the average per season over each group's average rebuilding time span. Data in this table is derived from Basketball-Reference.com. See Appendix A for definitions of statistics such as MP, GS, GP, etc.

Likewise, it is possible to infer from Tables 2.1 and 2.2 that front offices spearheading unsuccessful rebuilds made the mistake of signing players who were declining in skill to expensive contracts, further hampering the progress of their rebuilds. Due to this observation, I determined that ill-advised free agent signings/player extensions was a common factor negatively affecting the unsuccessful rebuilds.

Payroll Distribution

Similar to the study examining equitable payroll distributions conducted by Patterson, I analyzed the salaries of each team's ten highest paid players over their respective timelines (see Appendix D) and compared average payroll distributions. as displayed in Table 3 and Figure 1 below.

Table 3: Comparison of Average Salary Distributions Amongst Highest Paid Players

	Unsuccessful	Successful
Player Ranking	Average Salary (\$ millions)	Average Salary (\$ millions)
1	18.5	16.1
2	14.3	12.6
3	10.6	10.3
4	8.5	7.9
5	6.9	5.8
6	5.7	4.7
7	4.8	4.1
8	3.9	3.7
9	3.3	2.9
10	2.8	2.3

Note. Each data value is the average per season over each group's average rebuilding time span. Data in this table is derived from HoopsHype.com.

Figure 1: Stacked bar chart comparing the average yearly salary distributions of successful and unsuccessful rebuilds, similar to charts in equitable payroll distribution study (Patterson).

When comparing the two types of rebuilds, there does appear to be a slight difference in average payroll distribution. The two highest paid players for the unsuccessful rebuilds were paid about \$2 million more than the top two for the successful rebuilds. Also, players four through seven were paid approximately \$1 million more by the unsuccessful teams than their counterparts on the successful teams, followed by players nine through ten being paid around \$0.5 million more. The third and the eighth highest paid players were slight outliers, only being paid \$0.2-0.3 million more. The difference in average salaries and the fact that the unsuccessful group was paying their players (who were determined in Table 2.2 to be less efficient and less productive) more, on average, were clear indicators that payroll distribution was another common factor affecting unsuccessful rebuilds.

Draft Picks

The draft was the third factor that showed a clear difference between unsuccessful and successful rebuilds. As part of my collective case study, I analyzed each team's top three draft picks during their respective rebuilds. That analysis was based on player production as well as the quantity and quality of their minutes (see Appendix E). Similarly, an evaluation of each team's top draft pick can be seen in Table 4.1. For the most part, the top draft picks for the unsuccessful rebuilds averaged fewer points and started less games than their counterparts in the successful rebuilds.

Table 4.1: Comparison of Top Draft Picks for Each Team

Team	Player	Draft Class (Pk #)*	Start %**	PPG-RPG-APG**
Phoenix Suns	Devin Booker	2015 - #13	93.4%	22.8 - 3.7 - 4.8
Boston Celtics	Jayson Tatum	2017 - #3	100%	13.9 - 5.0 - 1.6
Philadelphia 76ers	Joel Embiid	2014 - #3	100%	23.5 - 10.8 - 3.0
Golden State Warriors	Klay Thompson	2011 - #11	81.3%	15.8 - 3.1 - 2.1
Brooklyn Nets	Jarrett Allen	2017 - #22	78.2%	10.1 - 7.8 - 1.2
Detroit Pistons	Greg Monroe	2010 - #7	88.5%	14.4 - 9.3 - 2.3
Sacramento Kings	De'Aaron Fox	2017 - #5	95.7%	19.7 - 3.6 - 6.3
Orlando Magic	Victor Oladipo	2013 - #2	75.3%	15.9 - 4.4 - 4.0

Note. Data in this table is derived from Basketball-Reference.com.

*Pick # represents overall pick number in the draft. For example, Pk # 13 for Devin Booker means he was the 13th overall pick in the 2015 draft.

**These are the stats each player accumulated over their team's rebuilding years, they are not stats representative of each player's entire career.

Table 4.2 shows that, on average, the top three draft picks for the unsuccessful rebuilds spent less time on the teams that drafted them, as well as starting fewer games and playing fewer minutes in those games. However, it is worth mentioning that those key players tended to be

selected lower in the draft. On a basic level this makes sense, because if Team X has a lower pick than Team Y, they usually end up with a worse player. Also, players drafted into unsuccessful rebuilds had a higher field goal percentage, which was another interesting observation.

Table 4.2: Comparison of Average Player Statistics for Key Retained Draft Picks

	Unsuccessful (5.8 yrs)	Successful (5.5 yrs)
Variables	Averages	Averages
Years On Team (total)	4.4 (13.3)	6.9 (20.8)
Pick #	12.3	9
GS (total)	45 (422)	47.5 (393)
GP (total)	64.4 (599)	67.3 (545)
Start %	66.4	70.6
MP	26.1	29.2
FG%	0.49	0.445
PPG	12.1	14.7
RPG	5.7	5.4
APG	2.3	3.2
Years during Rebuild*	3.1	3

Note. Each data value is the average per season for that group of rebuilds over the specified time span. Data in this table is derived from Basketball-Reference.com.

*Amount of years drafted player spent with team during the team's rebuilding process

Whether it was poor front office management of the NBA Draft process or bad player evaluations, the unsuccessful teams were less effective than the successful teams at finding “the guy” to build their franchise around. Taking all of this into account, I determined that draft picks were another one of the factors that came back to bite the teams with unsuccessful rebuilds.

Trades

Another factor that came into play was the amount of trades. The successful rebuilds made close to two more trades per year than the unsuccessful ones (see Table 1.3). When looking

further at the five best players each team acquired and the five best players each team traded away (see Appendix F), however, I noticed that the impact of the trades made was not a notable factor. I will note that, compared to their previous team, players did start and play fewer games with the unsuccessful teams, as shown in Table 5.1. Aside from that, the differences in minutes played, field goal percentage, points per game, rebounds per game, and assists per game were virtually the same for both types of rebuilds.

Table 5.1: Comparison of Player Statistics Before and After Being Acquired by the Rebuilding Teams

Variables	Unsuccessful		Successful	
	Previous Team	Rebuild Team	Previous Team	Rebuild Team
Tenure (years)	3.2	3.5	2.7	3
Avg GS	41	40	36	43
Avg GP	63	52	56	59
Start %	63.6	71.2	52	67.2
MP	25.2	27.8	27.3	29.3
FG%	0.447	0.458	0.441	0.465
PPG	12.1	14.3	12.4	14.5
RPG	4.3	4.8	4.4	4.8
APG	2.9	3.3	3.1	3.4
Age*	N/A	26.1	N/A	25.8

Note. Each data value is the average per season for that type of rebuild over the specified time span. Data in this table is derived from Basketball-Reference.com.

*Only the age at which they were acquired by the rebuilding team was recorded

The differences between the two types of rebuilds are almost identical when examining the aftermath of teams trading away key players in Table 5.2. Tenure, games started, and games played for players traded away from rebuilding teams, as a whole, all decreased. Granted, their start percentage and minutes played did slightly increase for players after being traded, but their statlines (PPG-RPG-APG) were essentially the same. The only significant variable that differed

somewhat was age, as the unsuccessful rebuilds traded away players who were younger by 0.7 years on average.

Table 5.2: Comparison of Player Statistics Before and After Being Traded Away from Rebuilding Teams

Variables	Unsuccessful		Successful	
	Rebuild Team	New Team	Rebuild Team	New Team
Tenure (years)	4.3	2.3	4.5	2.9
Avg GS	48	44	46	46
Avg GP	64	59	62	56
Start %	66.6	67.5	64.2	72.9
MP	28.3	30.1	28.2	29.1
FG%	0.462	0.468	0.452	0.449
PPG	13.9	14.5	13.4	13.2
RPG	5.3	5.1	4.3	4.1
APG	2.5	2.8	3.2	3.3
Age*	N/A	25.6	N/A	26.3

Note. Each data value is the average per season for that group of rebuilds over the specified time span. Data in this table is derived from Basketball-Reference.com.

*Only the age at which they were traded away by the rebuilding team was recorded

In general, the production and performance of key players being traded increased when being acquired by a rebuilding team and decreased when being traded away from a rebuilding team. Based on the trade aftermath results for both groups of rebuilds, I determined that the trades made and the players in those trades were not a considerable factor impacting the state of unsuccessful rebuilds. Curiously enough though, I did find a small sub-factor within my examination of each team's trades. The failure to go after superstar players was a sub-factor that was evident in the majority of the unsuccessful rebuilds, while not so evident in their counterparts (see Appendix F). The successful rebuilds each acquired one superstar at the tail end of their rebuild: the Suns acquired Chris Paul, the Celtics acquired Kyrie Irving, the 76ers

acquired Jimmy Butler, and the Warriors acquired Andre Igoudala. Meanwhile, the Nets were the only unsuccessful team to trade for superstars, acquiring both Kyrie Irving and Kevin Durant in the latter stages of their rebuild (Basketball-Reference). Each of these players, some more than others, helped to expedite and improve the rebuilding process for the successful teams, while the failure to acquire big-name players may have played a small role in hampering the unsuccessful rebuilds.

Team Culture

The fifth and final factor examined in my collective case study analysis was winning culture. Winning culture can be defined as an organizational “will to win” or desire to succeed that is reflected from the front office all the way down to the last player on the bench (Dennis). This can be quantified by examining statistics such as all time win percentage, playoff appearances, playoff record, and championships won to determine whether or not a lack of winning culture was a common factor in the unsuccessful rebuilds. Table 6.1 below shows a clear difference in team legacy and winning culture between the two types of rebuilds. On average, the unsuccessful rebuilds won seven hundred less games all time, won approximately thirteen fewer playoff games, and made five and a half fewer Finals appearances than their counterparts.

Table 6.1: Comparison of Averaged Statistics Associated With Team History and Legacy

	Unsuccessful	Successful
Variables	Team Averages	Team Averages
Seasons	47.8	63.3
All-Time Record (W-L)	1882-2091	2520-2208
Win Percentage	0.48	0.533
Playoff Appearances	25.2	38.8
Playoff Games	204	380

Playoff Record (Win %)	90-107 (0.457)	200-181 (0.525)
Finals Appearances	2.8	8.3
Championships	1	5.8
# of Hall of Famers	14.4	21.8

Note. Data in this table is derived from Basketball-Reference.com and StatMuse.com.

Table 6.2 is similar, but instead displays the total number of each variable associated with winning culture. What stood out to me was the apparent difference in championships won between the two groups, with the successful rebuilds winning a combined nineteen more championships than the unsuccessful batch. In addition, the unsuccessful teams played a combined total of 817 playoff games, which is about half the amount of the playoff games that the successful rebuilds played in. However, it is worth mentioning that some of these variables can be explained by the fact that the successful teams, on average, have been established NBA franchises for close to sixteen more seasons than the unsuccessful teams. Given the additional time in the league, it makes sense that these teams have made it to the playoffs more and have competed in more playoff games all time.

Table 6.2: Comparison of Totalled Statistics Associated With Team History and Legacy

	Unsuccessful	Successful
Variables	Team Totals	Team Totals
Seasons	191	253
All-Time Record (W-L)	7527-8364	10,079-8832
Win Percentage	0.48	0.533
Playoff Appearances	102	155
Playoff Games	817	1518
Playoff Record (Win %)	388-427 (0.463)	801-724 (0.525)
Finals Appearances	11	33
Championships	4	23
# of Hall of Famers	57	87

Note. Data in this table is derived from Basketball-Reference.com and StatMuse.com.

Nevertheless, the successful group was made up of teams with an established history and legacy of consistent winning prior to the inception of their rebuilds. The unsuccessful group was made up of teams with sporadic success that failed to foster and develop the consistent winning culture of their counterparts. It is clear that an absence of winning culture, as evidenced in the lack of all time regular season and playoff success, was another factor negatively contributing to the rebuilding process of the unsuccessful teams.

Discussion

The goal of my study was to identify the common factors that make an NBA rebuild unsuccessful through careful observation and comparison of the data surrounding four unsuccessful and four successful rebuilds within the last fifteen years.

Findings

Out of the five potential factors that arose from my collective case study analysis, four were determined to be common factors influencing the unsuccessful rebuilds. Those four were free agent signings and extensions, payroll distribution, draft picks, and a lack of winning culture. First, there was a clear divide in the free agent signings and extensions made between the two types of rebuilds. The unsuccessful teams signed and extended players to longer, more expensive contracts throughout their rebuilds (see Table 2.1), but had less success turning those players into effective and productive contributors compared to the successful teams (see Table 2.2). This finding relates to Mark Cuban's take mentioned earlier in the literature review, in which he emphasizes the consequences of signing players who do not fit into a team's culture (Cuban). Next, payroll distributions varied between rebuilds as the unsuccessful teams generally paid more for their best players (see Table 3). While neither group fully employed an equitable

payroll distribution, as Will Patterson argued for in his 2017 study, the unsuccessful rebuilds followed a slightly more tiered payroll structure, in which their best few players were paid significantly higher salaries, on average, than the rest of their roster (Patterson 6). The draft was another area where the unsuccessful rebuilds struggled to find a superstar for the future.

Sailofsky shared this sentiment regarding the struggle for some front offices to select the right players to blossom within their system due to either ignorance or an absence of statistical metrics (Sailofsky 2). Specifically, the best players drafted by the unsuccessful teams during their rebuilds started less and averaged fewer points than those drafted by the successful teams (see Tables 4.1 & 4.2). Surprisingly, trades made during the rebuilding process did not stand out as a negative factor for the unsuccessful rebuilds. The statistics of key players acquired and traded for each team varied little between each group (see Tables 5.1 & 5.2). In terms of synergistic lineups resulting after mutually beneficial trades (Maymin et. al 14-16), neither group of teams seemed to considerably benefit from the impact of players involved in trades made during rebuilding years. Lastly, a difference in winning culture was evident between types of rebuilds. Although they have been around longer, teams with successful rebuilds had a legacy of not only making it to the playoffs more, but also being more successful in the playoffs than teams with unsuccessful rebuilds (see Tables 6.1 & 6.2). The lack of an established and consistent culture of winning factored into the struggle for unsuccessful rebuilds to develop an effective roster of players dedicated to the goal of winning.

Fulfillment of Gap in the Research

My study addressed the gap in the research in two ways. First, I addressed the gap in research regarding various possible factors affecting NBA rebuilds by connecting and analyzing those factors brought up in the literature in order to identify and examine multiple common

factors, instead of just one. Secondly, I addressed the gap in research regarding how the factors mentioned affected certain rebuilds. The sources and studies brought up in my literature review failed to apply the factors they were examining specifically to rebuilds, but rather focused on some teams who were not rebuilding (Beene; Maymin et. al; Sailofsky; Patterson). By taking a different approach and examining each of the eight teams who had undergone major rebuilds within the last two decades, I was able to identify how each of the factors, (signings, payroll distribution, draft picks, and winning culture), affected both types of rebuilds. Using a collective case study analysis for both groups allowed me to pinpoint the four common factors stated, as well as decipher how each one had a negative impact on the four unsuccessful rebuilds.

Implications

Through the results of my study, NBA franchises going through or planning on entering into the rebuilding process of reshaping their roster will be able to assess the four contributing factors identified. Front offices can use this study to take a look at how key free agent signings and extensions, superstar or lack of superstar draft picks, and player contracts have impacted rebuilds in the past. They will also be able to assess whether or not a winning culture currently exists within their franchise in order to maintain it or establish a new team culture. By examining the mistakes of the four unsuccessful rebuilds, in addition to the beneficial strategies employed by the four successful rebuilds, teams will be better prepared to undergo an effective rebuild.

Limitations

This study contains a couple limitations worth discussing. First, the data collected on each team's signings, extensions, and trades was only drawn from a select few players. I only examined each team's five biggest player contracts/extensions signed and the ten most notable players acquired or traded during their rebuilding process. In regards to draft picks, I only

collected data on each team's three most impactful draft selections during each of their rebuilds. There were a number of quality draft picks whose statistics were not analyzed. These restrictions limited the pool of players that data could be collected from, hence limiting the full scope and impact of these transactions. Secondly, only a certain number of general and pertinent variables and statistics were used to measure player production such as PPG, FG%, Start %, and MP. While these certainly gave a good picture of a player's impact, they did not entirely capture a player's true effectiveness. The full extent of the trades, signings, and draft picks made could have been better measured had more variables been taken into account.

Future Research

The limitations of this study help lead to inspiration for areas of future research. For example, going back thirty years instead of fifteen years would allow for the first major rebuilds such as the Boston Celtics early 1990's rebuild and the Chicago Bulls early 2000's rebuild (Mike B.) to be analyzed. Also, more factors could have been taken into account such as front office behavior, coaching, and fanbase impact through a more extensive analysis. Specifically, looking at the coaches hired by rebuilding franchises and their impact on player performance and team chemistry is a factor that was not addressed in this study.

Conclusion

Through a collective case study analysis, eight major NBA rebuilds over the last fifteen years were divided into two groups, four unsuccessful and four successful teams. Two rounds of research were then conducted in order to identify common factors negatively impacting unsuccessful rebuilds. The preliminary results found five potential factors (free agent signings and extensions, payroll distribution, draft picks, trades, and team culture) impacting both groups in different ways. From there, each factor was analyzed team-by-team and results for the two

types of rebuilds were compared. Based on the data collection, four out of the five factors (trades were not a considerable factor) were determined to have commonly impacted the rebuilding process for each of the four unsuccessful teams. This study was limited in the scope and quantity of the rebuilds examined, but future research will allow for a deeper understanding of the full range of factors that contribute to the success and failure of NBA rebuilds.

APPENDICES

Appendix A: *Definition of Terms and Statistics*

- Win % - Winning percentage
- PPG - points per game
- OPPG - opponent points per game
- ORtg - offensive rating: used to measure either a team's offensive performance or an individual player's efficiency at producing points for the offense (Wikipedia)
- DRtg - defensive rating: a statistic used to measure how many points a player or team allows on average over the course of 100 team possessions (SportsLingo.com)
- APA - average player age
- Lottery pick - any player selected #1-14 overall in the NBA Draft (Wikipedia)
- MP - minutes played
- GS - games started
- GP - games played
- Start % - the percentage of games a player started per season
- FG% - field goal percentage; the percent of shots made divided by the amount of shots taken
- RPG - rebounds per game
- APG - assists per game

Appendix E: Overview of Each Team's Three Key Retained Draft Picks and Their Statistics During the Rebuilding Process (Data Derived from Basketball-Reference.com)

Table A: Phoenix Suns Top Three Retained Draft Picks (2013-2020)

Draft Class	Player	Round # - Pick #	Years on Team
2014	TJ Warren	Rd 1 - Pk 14	2014-19 (5 years)
2015	Devin Booker	Rd 1 - Pk 13	2015-2023 (8 years)
2018	Deandre Ayton	Rd 1 - Pk 1	2018-2023 (5 years)

Table B: Phoenix Suns Retained Draft Picks' Statistics During Rebuild (2013-2020)

Season	Player	Position	GS/GP	Start %	MP	FG%	PPG-RPG-APG
2014-15	TJ Warren	SF	1/40	2.5	15.4	0.528	6.1 - 2.1 - 0.6
2015-16	TJ Warren	SF	4/47	8.5	22.8	0.501	11.0 - 3.1 - 0.9
2016-17	TJ Warren	SF	59/66	89.40	31	0.495	14.4 - 5.1 - 1.1
2017-18	TJ Warren	SF	65/65	100	33	0.498	19.6 - 5.1 - 1.3
2018-19	TJ Warren	SF	36/43	83.7	31.6	0.486	18.0 - 4.0 - 1.5
Average			33/52	56.8	26.8	0.502	13.8 - 3.9 - 1.1
2015-16	Devin Booker	SG	51/76	67.10	27.7	0.423	13.8 - 2.5 - 2.6
2016-17	Devin Booker	SG	78/78	100	35	0.423	22.1 - 3.2 - 3.4
2017-18	Devin Booker	SG	54/54	100.00	34.5	0.432	24.9 - 4.5 - 4.7
2018-19	Devin Booker	SG	64/64	100.00	35	0.467	26.6 - 4.1 - 6.8
2019-20	Devin Booker	SG	70/70	100.00	35.9	0.489	26.6 - 4.2 - 6.5
Average			63/68	93.4	33.6	0.447	22.8 - 3.7 - 4.8
2018-19	Deandre Ayton	C	70/71	98.6	30.7	0.585	16.3 - 10.3 - 1.8
2019-20	Deandre Ayton	C	32/38	84.2	32.5	0.546	18.2 - 11.5 - 1.9
Average			51/55	91.4	31.6	0.566	17.4 - 10.9 - 1.9

Table C: Boston Celtics Top Three Retained Draft Picks (2013-2018)

Draft Class	Player	Round # - Pick #	Years on Team
2014	Marcus Smart	Rd 1 - Pk 6	2014-2023 (9)
2016	Jaylen Brown	Rd 1 - Pk 3	2016-2023 (7)
2017	Jayson Tatum	Rd 1 - Pk 3	2017-2023 (6)

Table D: Boston Celtics Retained Draft Picks' Statistics During Rebuild (2013-2018)

Season	Player	Position	GS/GP	Start %	MP	FG%	PPG-RPG-APG
2014-15	Marcus Smart	PG	38/67	56.7	27	0.367	7.8 - 3.3 - 3.1
2015-16	Marcus Smart	PG	10/61	16.40%	27.3	0.348	9.1 - 4.2 - 3.0
2016-17	Marcus Smart	PG	24/79	30.4	30.4	0.359	10.6 - 3.9 - 4.6
2017-18	Marcus Smart	PG	11/54	20.40%	29.9	0.367	10.2 - 3.5 - 4.8
Average			21/65	31.8	28.7	0.36	9.4 - 3.7 - 3.9
2016-17	Jaylen Brown	SF	20/78	25.6	17.2	0.454	6.6 - 2.8 - 0.8
2017-18	Jaylen Brown	SG	70/70	100.00%	30.7	0.465	14.5 - 4.9 - 1.6
Average			45/74	60.8	24	0.46	10.6 - 3.9 - 1.2
2017-18	Jayson Tatum	SF	80/80	100	30.5	0.475	13.9 - 5.0 - 1.6
Average			80/80	100	30.5	0.475	13.9 - 5.0 - 1.6

Table E: Philadelphia 76ers Top Three Retained Draft Picks (2013-2019)

Draft Class	Player	Round # - Pick #	Years on Team
2013	Michael Carter-Williams	Rd 1 - Pk 11	2013-15 (2 years)
2014	Joel Embiid	Rd 1 - Pk 3	2014-2023 (9 years)
2016	Ben Simmons	Rd 1 - Pk 1	2016-2021 (5 years)

Table F: Philadelphia 76ers Retained Draft Picks' Statistics During Rebuild (2013-2019)

Season	Player	Position	GS/GP	Start %	MP	FG%	PPG-RPG-APG
2013-14	Michael Carter-Williams	PG	70/70	100	34.5	0.405	16.7 - 6.2 - 6.3
2014-15	Michael Carter-Williams	PG	38/41	92.7	33.9	0.38	15.0 - 6.2 - 7.4
Average			54/56	96.40%	34.2	0.393	15.9 - 6.2 - 6.9
2014-15	Joel Embiid	C	DNP	DNP	DNP	DNP	DNP
2015-16	Joel Embiid	C	DNP	DNP	DNP	DNP	DNP
2016-17	Joel Embiid	C	31/31	100.00	25.4	0.466	20.2 - 7.8 - 2.1
2017-18	Joel Embiid	C	63/64	100.00	30.3	0.483	22.9 - 11.0 - 3.2
2018-19	Joel Embiid	C	64/64	100.00	33.7	0.484	27.5 - 13.6 - 3.7
Average			53/53	100.00%	29.8	47.80%	23.5 - 10.8 - 3.0
2016-17	Ben Simmons	PG	DNP	DNP	DNP	DNP	DNP
2017-18	Ben Simmons	PG	81/81	100.00	33.7	0.545	15.8 - 8.1 - 8.2
2018-19	Ben Simmons	PG	79/79	100.00	34.2	0.563	16.9 - 8.8 - 7.7
Average			80/80	100.00%	34	0.554	16.4 - 8.5 - 8.0

Table F: Golden State Warriors Top Three Retained Draft Picks (2010-2014)

Draft Class	Player	Round # - Pick #	Years on Team
2011	Klay Thompson	Rd 1 - Pk 11	2011-2023 (12 years)
2012	Harrison Barnes	Rd 1 - Pk 7	2012-16 (4 years)
2012	Draymond Green	Rd 2 - Pk 35	2012-2023 (11 years)

Table G: Golden State Warriors Retained Draft Picks' Statistics During Rebuild (2010-2014)

Season	Player	Position	GS/GP	Start %	MP	FG%	PPG-RPG-APG
2011-12	Klay Thompson	SG	29/66	43.9	24.4	0.443	12.5 - 2.4 - 2.0
2012-13	Klay Thompson	SG	82/82	100.00	35.8	0.422	16.6 - 3.7 - 2.2
2013-14	Klay Thompson	SG	81/81	100	35.4	0.444	18.4 - 3.1 - 2.2
Average			64/76	81.30%	31.9	0.436	15.8 - 3.1 - 2.1
2012-13	Harrison Barnes	SF	81/81	100	25.4	0.439	9.2 - 4.1 - 1.2
2013-14	Harrison Barnes	SF	24/78	30.80	28.3	0.399	9.5 - 4.0 - 1.5
Average			53/80	65.40%	26.9	0.419	9.4 - 4.1 - 1.4
2012-13	Draymond Green	C	1/79	1.3	13.4	0.327	2.9 - 3.3 - 0.7
2013-14	Draymond Green	SF/PF	12/82	14.6	21.9	0.407	6.2 - 5.0 - 1.9
Average			7/81	8	17.7	0.367	4.6 - 4.2 - 1.3

Table G: Brooklyn Nets Top Three Retained Draft Picks (2015-2020)

Draft Class	Player	Round # - Pick #	Years on Team
2017	Jarrett Allen	Rd 1 - Pk 22	2017-21 (4 years)
2018	Rodions Kurucs	Rd 2 - Pk 40	2018-2021 (3 years)
2019	Nicolas Claxton	Rd 2 - Pk 31	2019-2023 (4 years)

Table H: Brooklyn Nets Retained Draft Picks' Statistics During Rebuild (2015-2020)

Season	Player	Position	GS/GP	Start %	MP	FG%	PPG-RPG-APG
2017-18	Jarrett Allen	C	31/72	43.1	20	0.589	8.2 - 5.4 - 0.7
